# Database roles and access control

**DATABASE DESIGN** 

**Lis Sulmont**Curriculum Manager

#### Granting and revoking access to a view

```
GRANT privilege(s) or REVOKE privilege(s)
ON object
TO role or FROM role
```

- Privileges: SELECT, INSERT, UPDATE, DELETE, etc.
- Objects: table, view, schema, etc.
- Roles: a database user or a group of database users

```
GRANT UPDATE ON ratings TO PUBLIC;
REVOKE INSERT ON films FROM db_user;
```

#### Database roles

- Manage database access permissions
- A database role is an entity that contains information that:
  - Define the role's privileges
    - Can you login?
    - Can you create databases?
    - Can you write to tables?
  - Interact with the client authentication system
    - Password
- Roles can be assigned to one or more users
- Roles are global across a database cluster installation

#### Create a role

Empty role

```
CREATE ROLE data_analyst;
```

Roles with some attributes set

```
CREATE ROLE intern WITH PASSWORD 'PasswordForIntern' VALID UNTIL '2020-01-01';
```

```
CREATE ROLE admin CREATEDB;
```

```
ALTER ROLE admin CREATEROLE;
```

<sup>&</sup>lt;sup>1</sup> http://bit.ly/postgresql\_attributes

#### GRANT and REVOKE privileges from roles

GRANT UPDATE ON ratings TO data\_analyst;

REVOKE UPDATE ON ratings FROM data\_analyst;

The available privileges in PostgreSQL are:

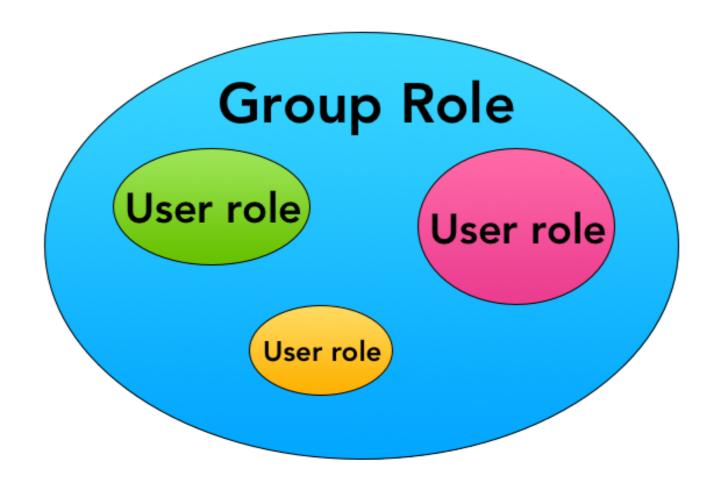

• SELECT, INSERT, UPDATE, DELETE, TRUNCATE, REFERENCES, TRIGGER, CREATE, CONNECT, TEMPORARY, EXECUTE, and USAGE

<sup>&</sup>lt;sup>1</sup> http://bit.ly/postgresql\_privileges

### Users and groups (are both roles)

- A role is an entity that can function as a user and/or a group
  - User roles
  - Group roles

## Users and groups (are both roles)

#### Group role

```
CREATE ROLE data_analyst;
```

#### User role

```
CREATE ROLE intern WITH PASSWORD 'PasswordForIntern' VALID UNTIL '2020-01-01';
```

### Users and groups (are both roles)

#### Group role

```
CREATE ROLE data_analyst;
```

#### User role

```
CREATE ROLE alex WITH PASSWORD 'PasswordForIntern' VALID UNTIL '2020-01-01';
```

```
GRANT data_analyst TO alex;
```

```
REVOKE data_analyst FROM alex;
```

## Common PostgreSQL roles

Role	Allowed access
pg_read_all_settings	Read all configuration variables, even those normally visible only to superusers.
pg_read_all_stats	Read all pg_stat_* views and use various statistics related extensions, even those normally visible only to superusers.
pg_signal_backend	Send signals to other backends (eg: cancel query, terminate).
More	More

<sup>&</sup>lt;sup>1</sup> http://bit.ly/default\_roles\_postgresql

#### Benefits and pitfalls of roles

#### **Benefits**

- Roles live on after users are deleted
- Roles can be created before user accounts
- Save DBAs time

#### **Pitfalls**

- Sometimes a role gives a specific user too much access
  - You need to pay attention

## Let's practice!

DATABASE DESIGN

## Table partitioning

DATABASE DESIGN

**Lis Sulmont**Curriculum Manager

### Why partition?

Tables grow (100s Gb / Tb)

Problem: queries/updates become slower

Because: e.g., indices don't fit memory

Solution: split table into smaller parts (= partitioning)

### Data modeling refresher

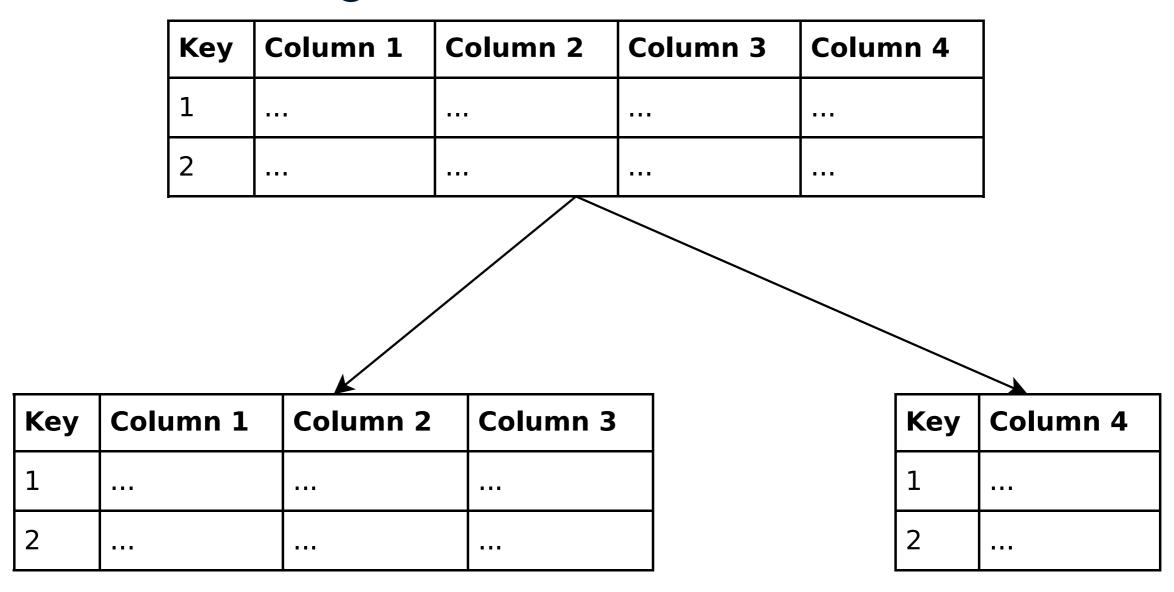

- 1. Conceptual data model
- 2. Logical data model

For partitioning, logical data model is the same

3. Physical data model

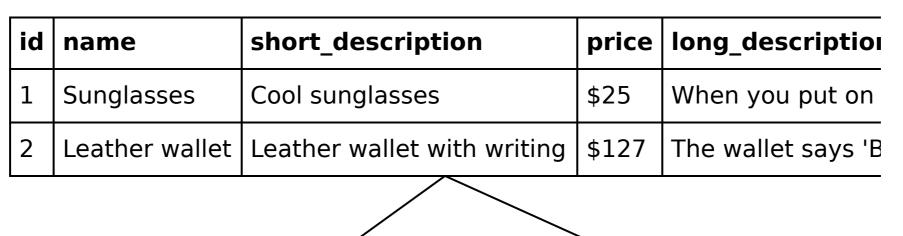

Partitioning is part of physical data model

### Vertical partitioning

Split table even when fully normalized

#### Vertical partitioning: an example

id	name	short_description	price
1	Sunglasses	Cool sunglasses	\$25
2	Leather wallet	Leather wallet with writing	\$127

id	long_description				
1	When you put on these				
2	The wallet says 'Bad				

E.g., store long\_description on slower medium

## Horizontal partitioning

			_	Key	Column 1	timestamp
Key	Column 1	timestamp		1		2018-01-01
1		2018-01-01		2		
2				3		2018-31-01
3		2018-31-01			•	
4		2019-01-01		Key	Column 1	timestamp
5				4		2019-01-01
6		2019-31-01		5		
				6		2019-31-01

## Horizontal partitioning: an example

id	product_id	amount	total_price	timestamp
1	123	1	\$102	2019-04-01
2	101	7	\$21	2019-23-02
3	18202	1	\$499	2019-30-04
4	1762	15	\$1500	2019-21-08
5	10	1	\$5	2019-30-08
6	123	1	\$102	2019-29-10

#### Horizontal partitioning: an example

id	product_id	amount	total_price	timestamp	
1	123	1	\$102	2019-04-01	04 ('('
2	101	7	\$21	2019-23-02	Q1 partition
3	18202	1	\$499	2019-30-04	Q2 partition
4	1762	15	\$1500	2019-21-08	O2 portition
5	10	1	\$5	2019-30-08	Q3 partition
6	123	1	\$102	2019-29-10	Q4 partition

```
CREATE TABLE sales (
    ...
    timestamp DATE NOT NULL
)

PARTITION BY RANGE (timestamp);

CREATE TABLE sales_2019_q1 PARTITION OF sales
    FOR VALUES FROM ('2019-01-01') TO ('2019-03-31');
...

CREATE TABLE sales_2019_q4 PARTITION OF sales
    FOR VALUES FROM ('2019-10-01') TO ('2020-01-31');
CREATE INDEX ON sales ('timestamp');
```

#### Pros/cons of horizontal partitioning

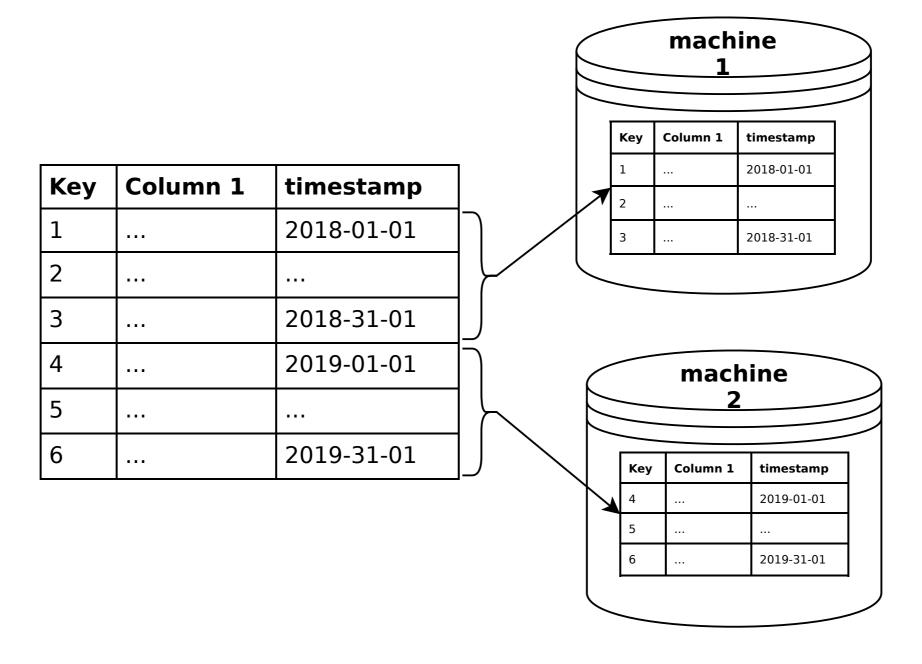

#### Pros

- Indices of heavily-used partitions fit in memory
- Move to **specific medium**: slower vs. faster
- Used for both OLAP and OLTP

#### Cons

- Partitioning existing table can be a hassle
- Some constraints can not be set

### Relation to sharding

## Let's practice!

DATABASE DESIGN

## Data integration

DATABASE DESIGN

**Lis Sulmont**Curriculum Manager

### What is data integration

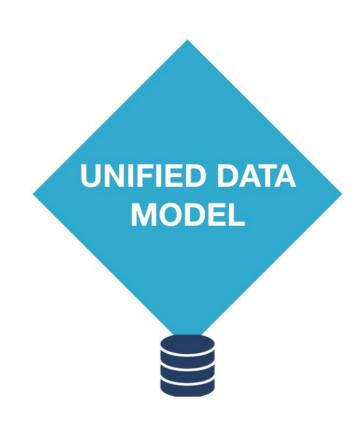

Data Integration combines data from different sources, formats, technologies to provide users with a translated and unified view of that data.

#### Business case examples

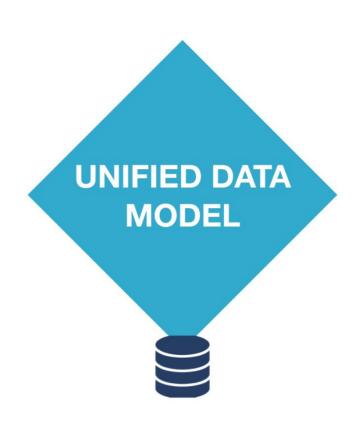

- 360-degree customer view
- Acquisition
- Legacy systems

#### Unified data model

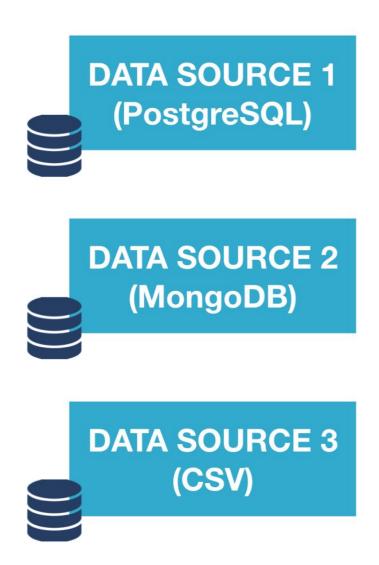

#### Data sources

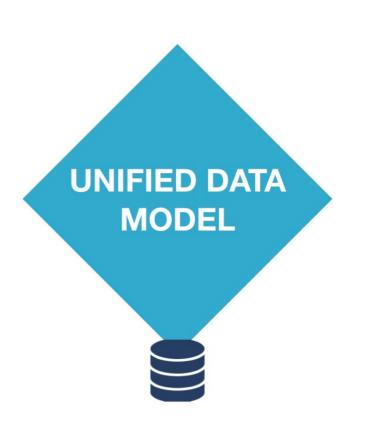

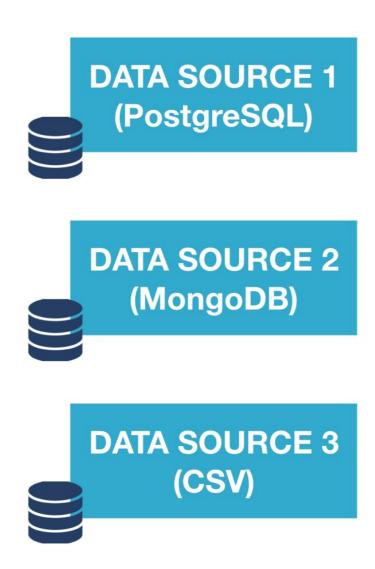

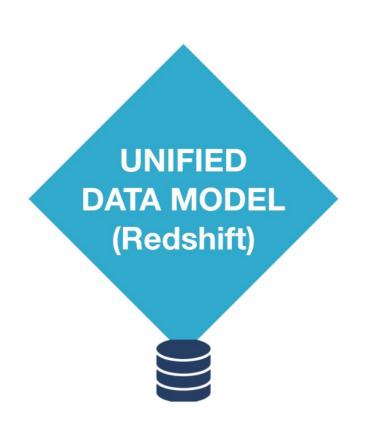

#### Data sources format

#### Unified data model format

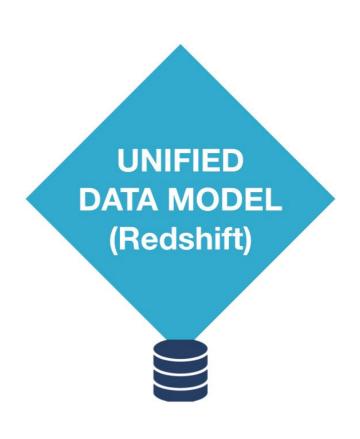

#### **Example: DataCamp**

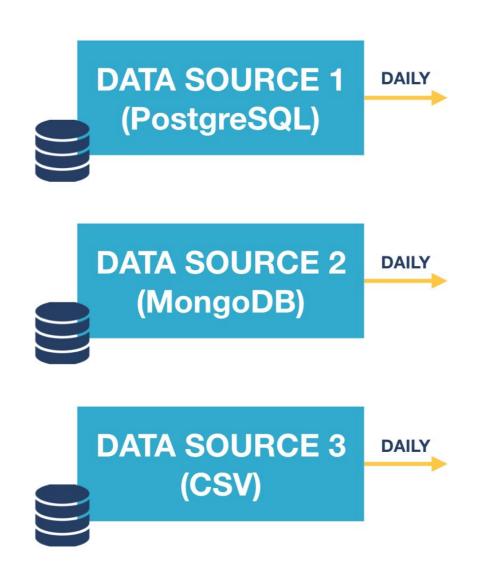

Product
(MongoDB)

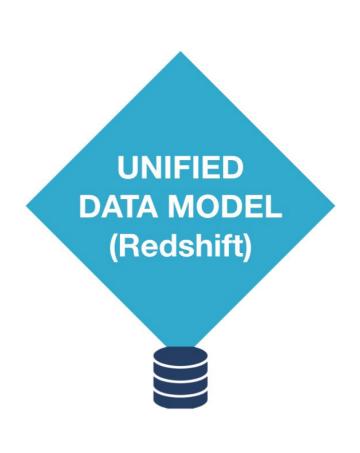

behavioral data

Marketing (CSV) contact data

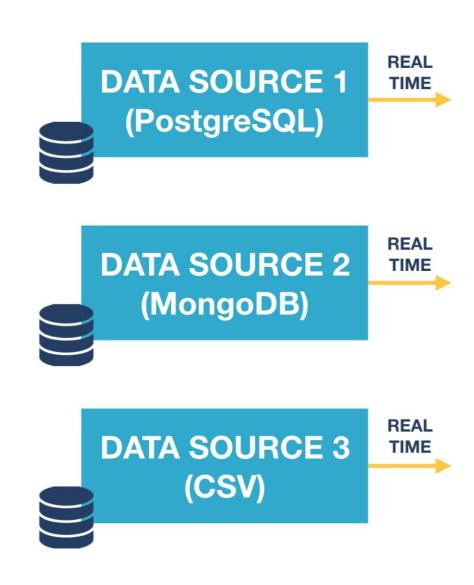

#### Update cadence - sales

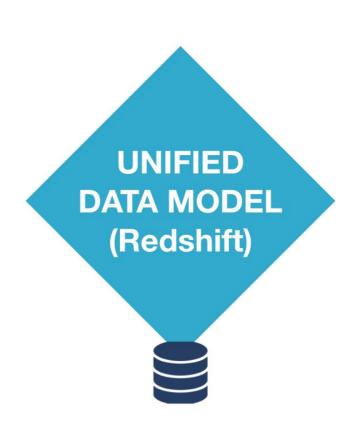

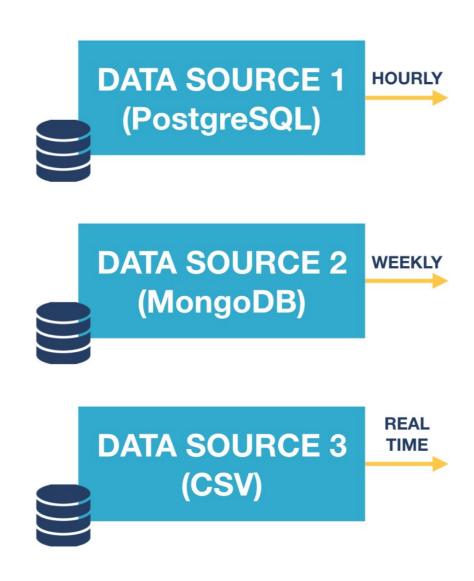

#### Update cadence - air traffic

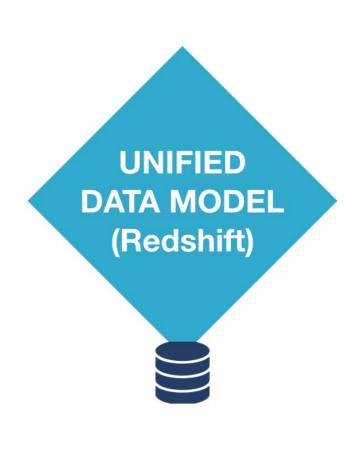

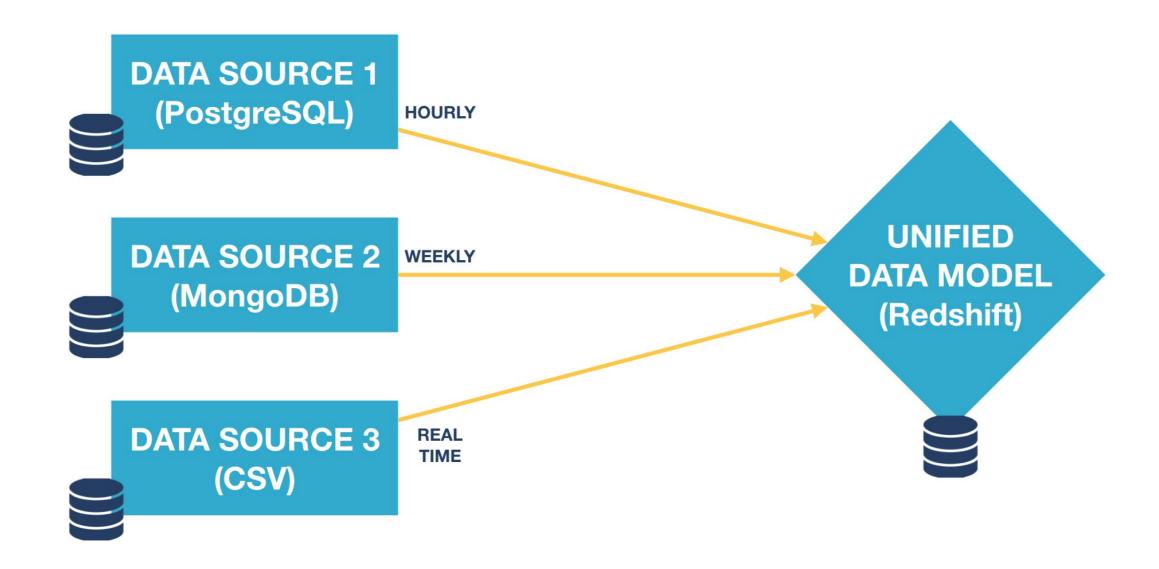

## Different update cadences

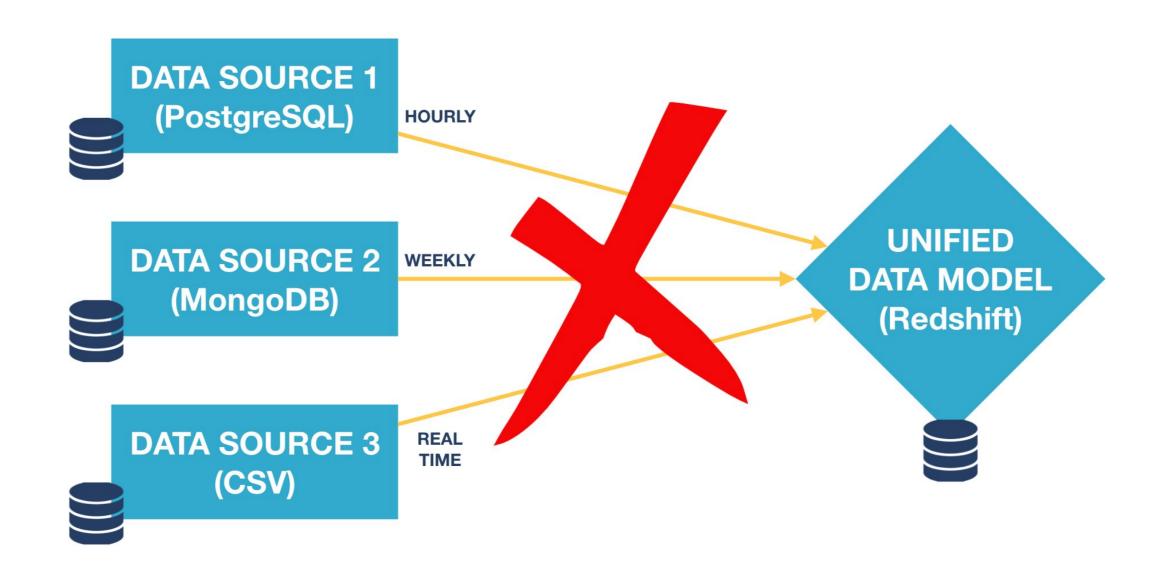

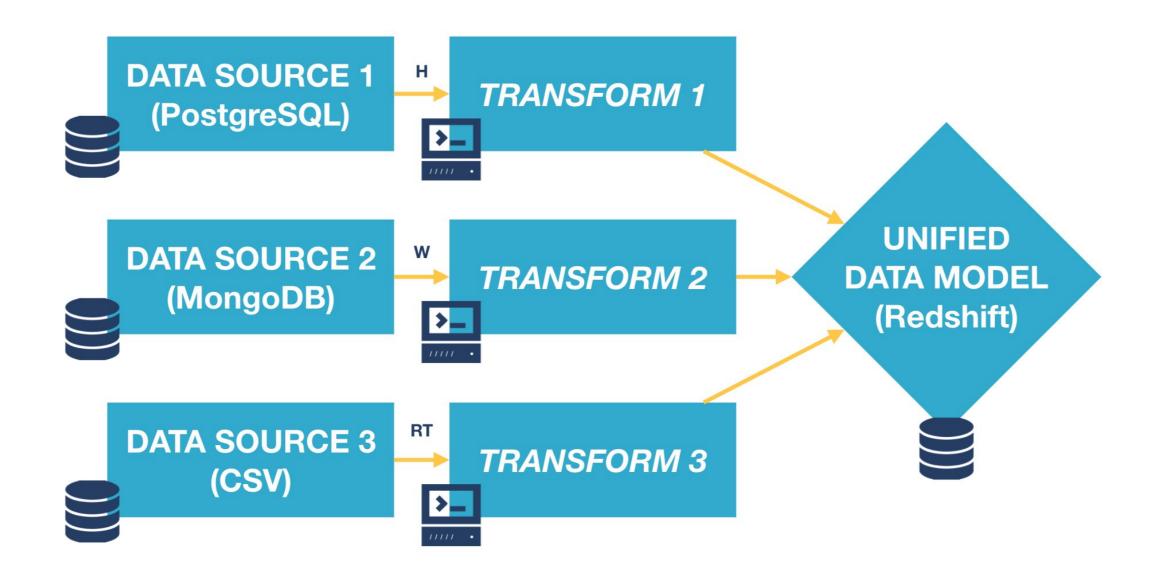

## So simple?

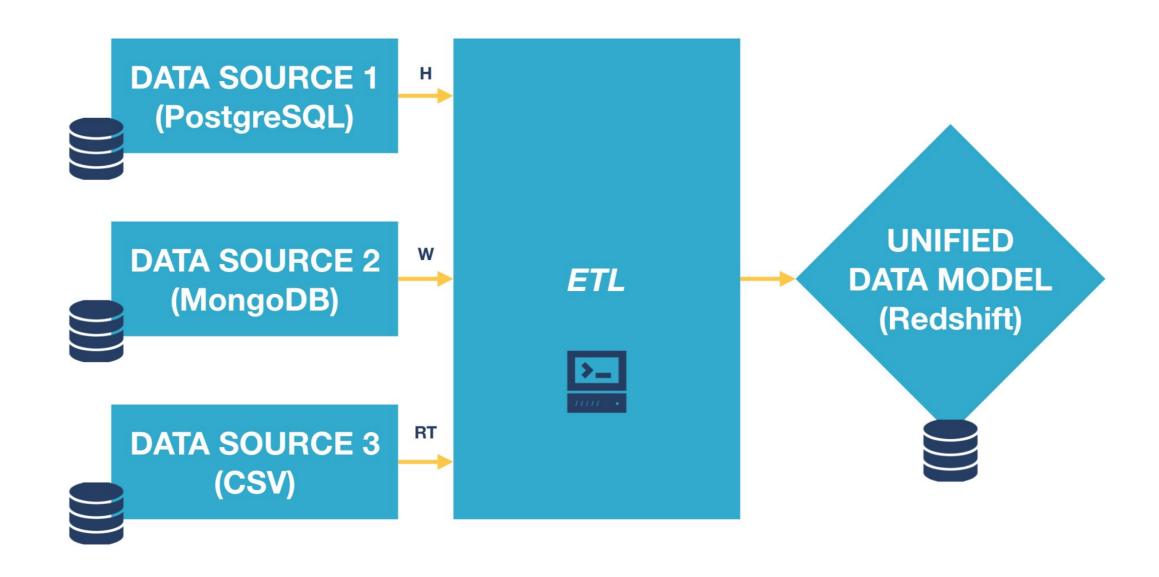

## Not really

#### **Transformations**

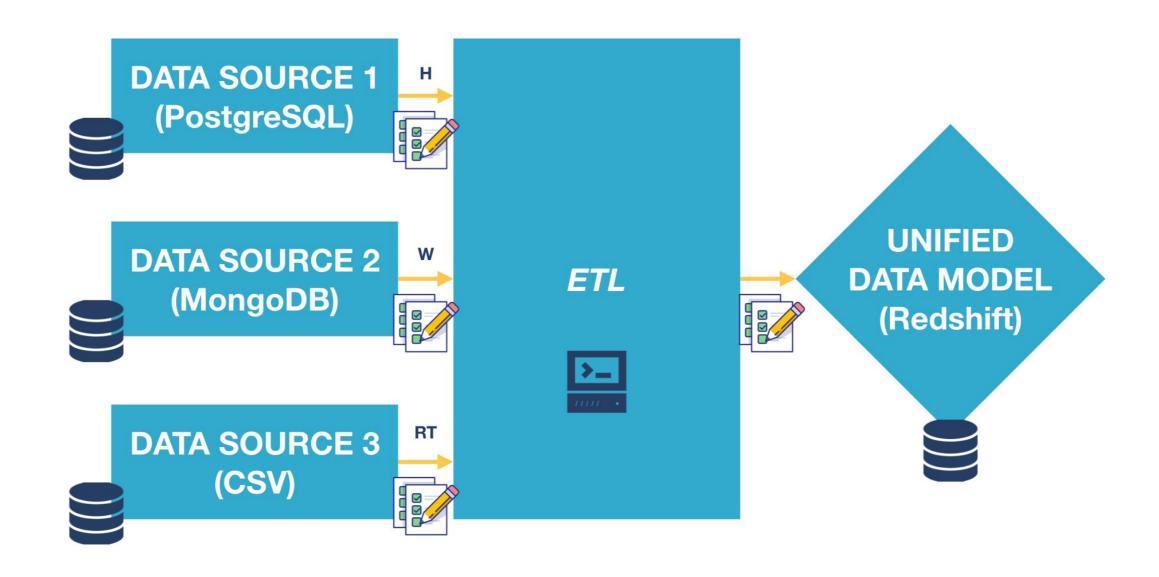

#### **Transformation - tools**

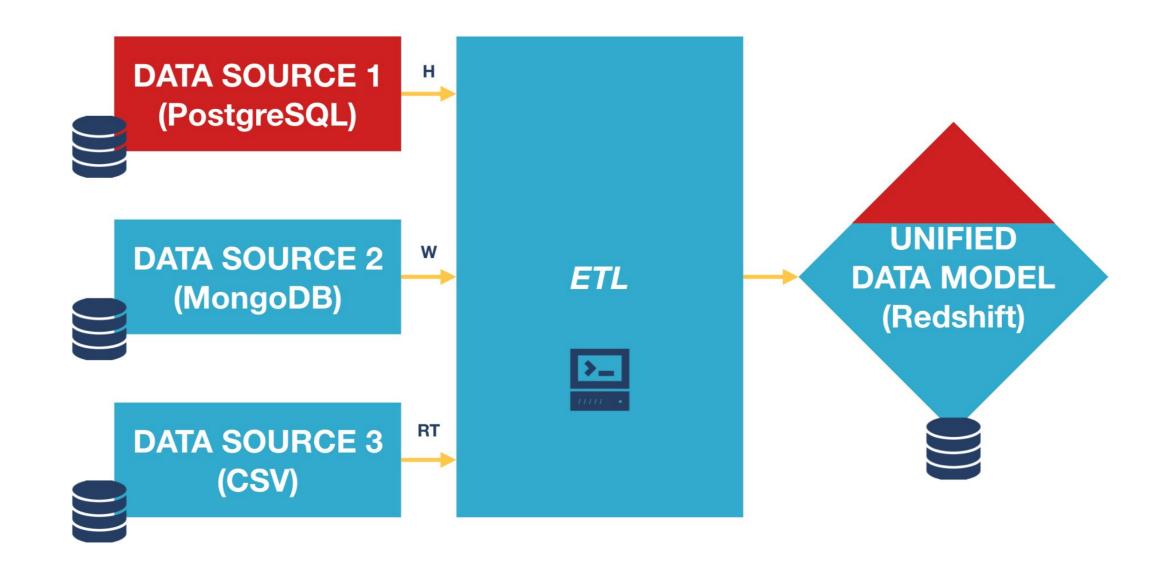

## Choosing a data integration tool

- Flexible
- Reliable
- Scalable

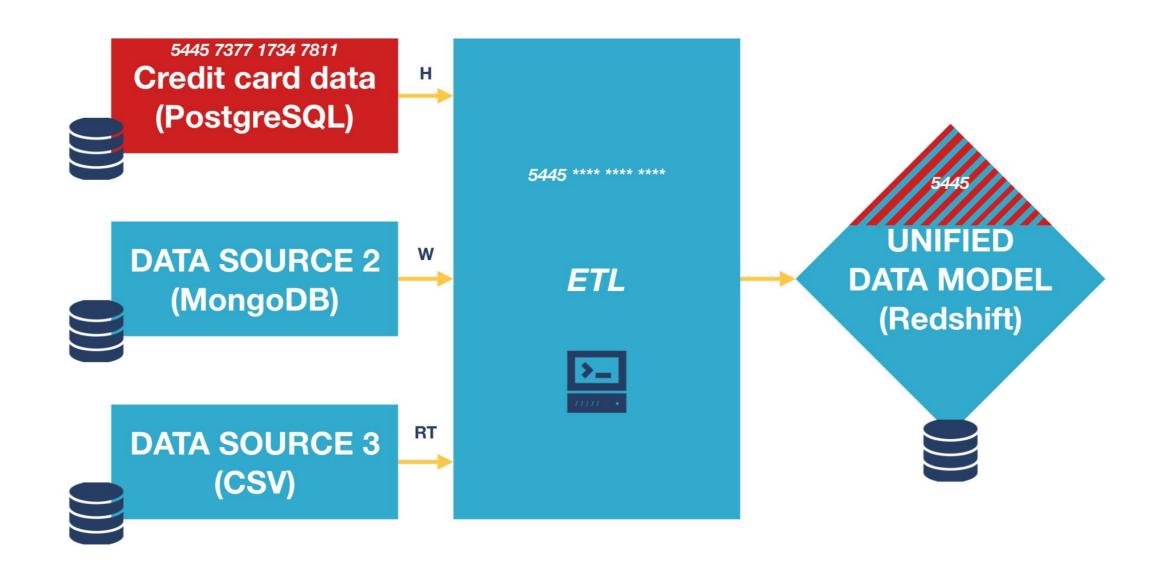

### Automated testing and proactive alerts

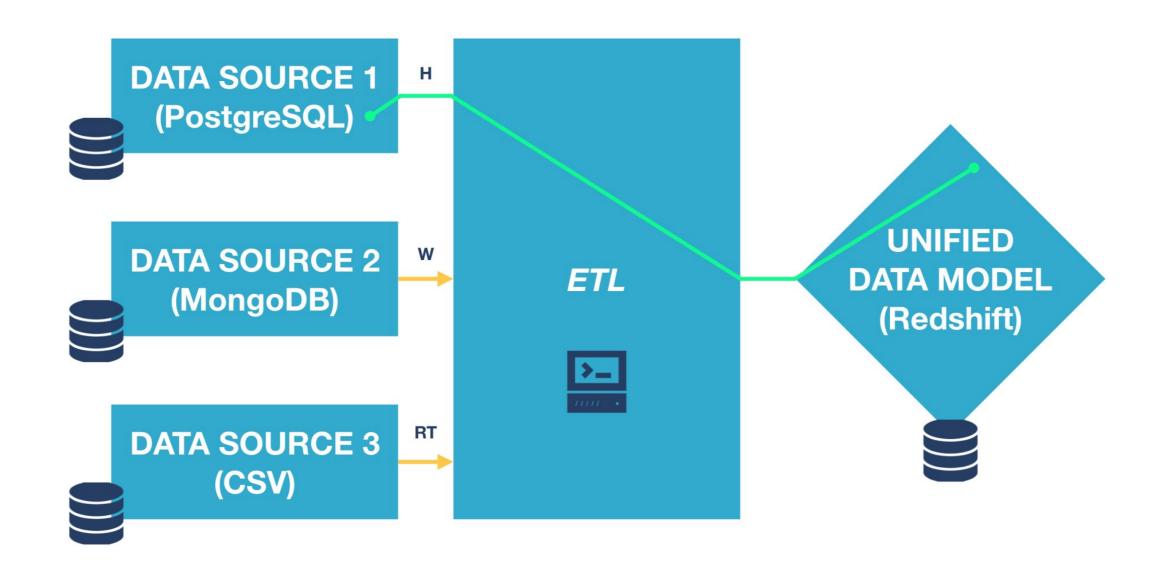

## Security

## Security - credit card anonymization

## Data governance - lineage

# Let's practice!

DATABASE DESIGN

# Picking a Database Management System (DBMS)

DATABASE DESIGN

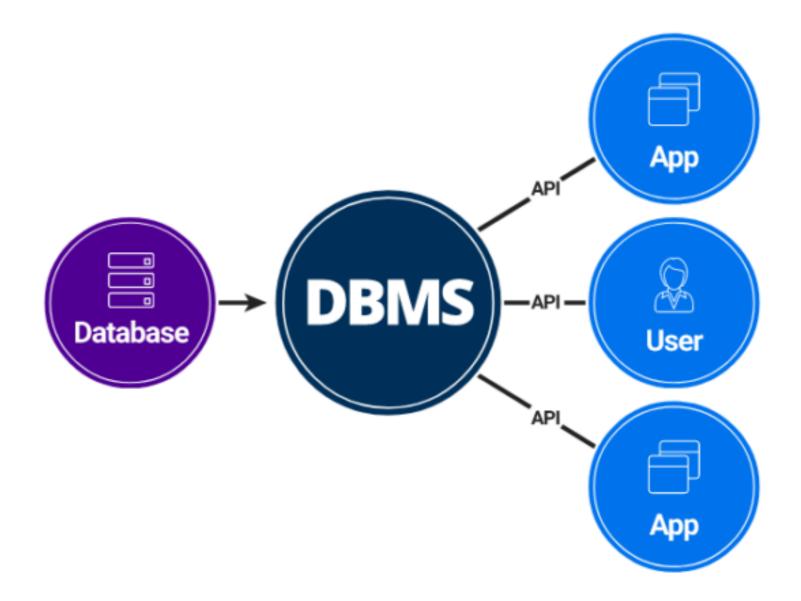

SQL

**Lis Sulmont**Curriculum Manager

#### **DBMS**

- DBMS: DataBase Management System
- Create and maintain databases
  - Data
  - Database schema
  - Database engine
- Interface between database and end users

## **DBMS** types

- Choice of DBMS depends on database type
- Two types:
  - SQL DBMS
  - NoSQL DBMS

#### SQL DBMS

- Relational DataBase Management System (RDBMS)
- Based on the relational model of data
- Query language: SQL
- Best option when:
  - Data is structured and unchanging
  - Data must be consistent

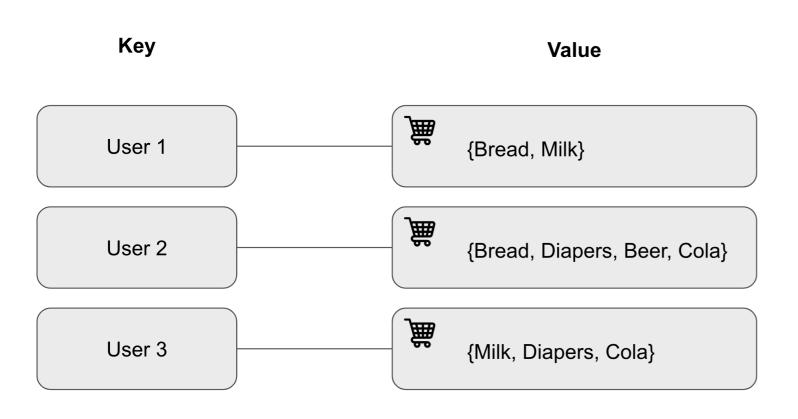

#### NoSQL DBMS

- Less structured
- Document-centered rather than table-centered
- Data doesn't have to fit into well-defined rows and columns
- Best option when:
  - Rapid growth
  - No clear schema definitions
  - Large quantities of data
- Types: key-value store, document store, columnar database, graph database

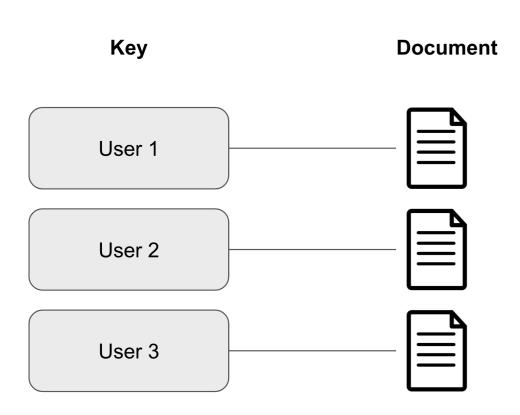

## NoSQL DBMS - key-value store

- Combinations of keys and values
  - Key: unique identifier
  - Value: anything
- Use case: managing the shopping cart for an on-line buyer
- Example:

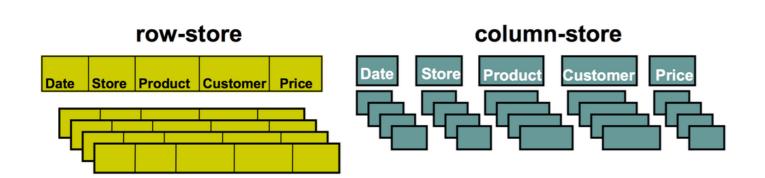

#### NoSQL DBMS - document store

- Similar to key-value
- Values (= documents) are structured
- Use case: content management
- Example:

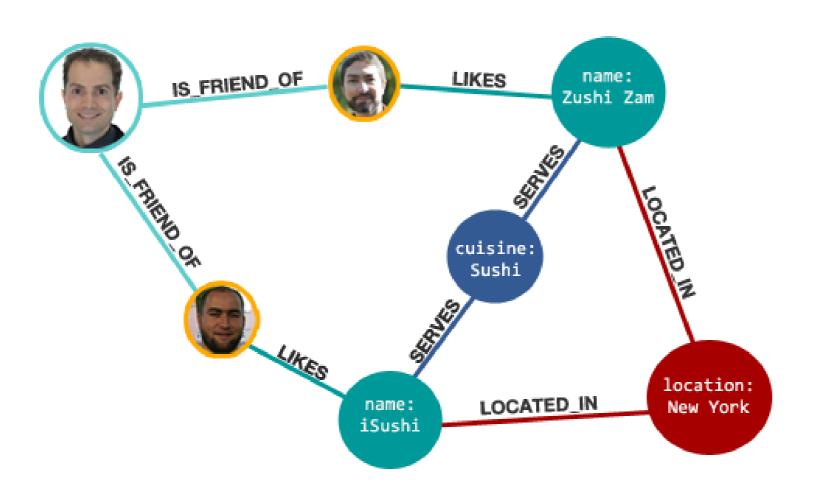

#### NoSQL DBMS - columnar database

- Store data in columns
- Scalable
- Use case: big data analytics where speed is important
- Example:

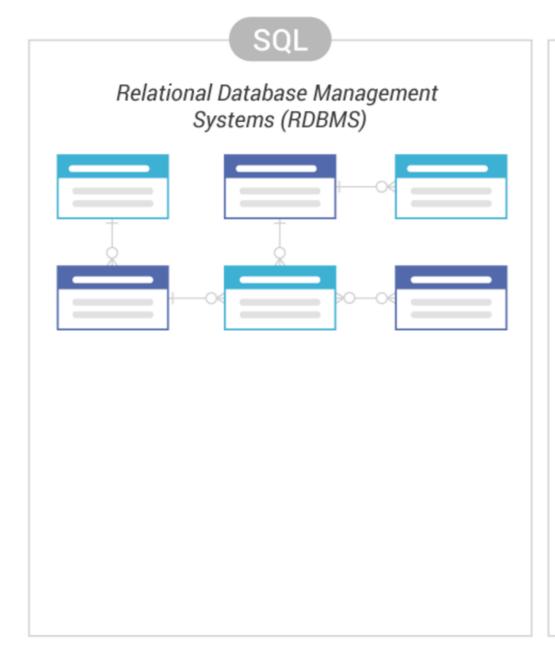

### NoSQL DBMS - graph database

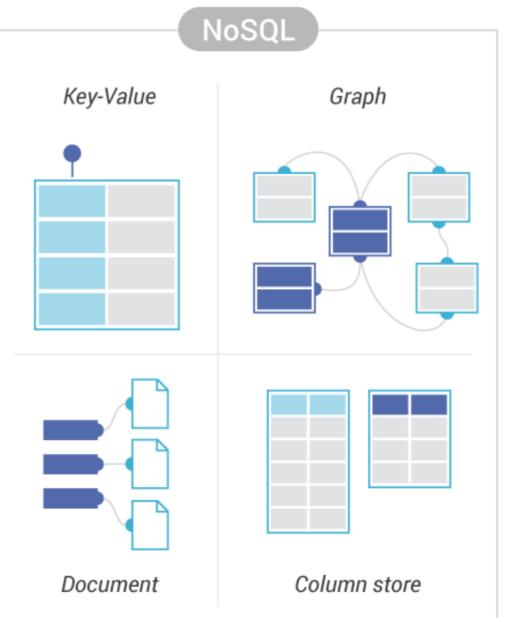

- Data is interconnected and best represented as a graph
- Use case: social media data, recommendations
- Example:

## Choosing a DBMS

# Let's practice!

DATABASE DESIGN
